

Nat Spirit

Silicone,

miracle component made of a combination of quartz rock and carbon at high temperatures

Contrary to some preconceived ideas, silicone is not made of hydrocarbons or plastics but, like glass and ceramics, of silicium in the form of sand and rock. After oxygen, silicon is the second most abundant chemical element and the most important raw material for mineral materials. So there is no risk of shortage here !

Our silicone collections are the perfect sustainable alternative to plastic tableware:

Free of BPA, PVC or phthalates, there is no varnish, nor coating on the surface of our products. Therefore they will never fade, peel or leach harmful chemicals.

All products undergo regular and rigorous testing according EU regulations 1935/2004.
